

Think9 Intelligence Hub

Suggested Slide Visual: Centralized intelligence ring connecting 30+ brand nodes.

Fragmented Intelligence at Scale

- **Key Points**:
- Think9 operates 30+ distinct consumer brands (AURA, NEXA, VIVA, etc.).
- Customer feedbacks, specs, supply chains, and documents are siloed.
- Repeating identical investigations (e.g. cap leakages, supplier failures) wastes hundreds of manual hours.
- Context is lost when brand managers change.

Centralized Organizational Learning

- **Key Points**:
- Unify all product specifications, reviews, support tickets, and corporate SOPs.
- Transform historical decisions and outcomes into dynamic "institutional memory".
- Enable any brand to automatically learn from structural patterns solved by another brand.

Centralized Decision Pipeline

- **Key Points**:
- **Data Ingestion**: Support PDF, TXT, and CSV formats.
- **Knowledge Layer**: SQLite metadata schema + TF-IDF semantic vector retrieval.
- **Agentic Workflow**: Five logical specialized agents working sequentially.
- **Human-In-The-Loop (HITL)**: Mandatory review & edit board before deployment.
- **Decision Memory**: Retrievable historical repository.

Collaborative Multi-Agent Workforce

- **Key Points:**
- **1. Router Agent:** Discovers targeted brand, product, and query intent.
- **2. Research Agent:** Queries database and fetches relevant RAG snippets.
- **3. Analysis Agent:** Detects recurring complaints, reviews, and signals.
- **4. Memory Agent:** Cross-references historical solutions across other brands.
- **5. Recommendation Agent:** Formulates proposed solutions and confidence scores.

Keeping Humans in Absolute Control

- **Key Points**:
- AI does not execute high-impact adjustments autonomously.
- Renders detailed findings, confidence ratings, and evidence packages.
- Dashboard enables human operators to Approve, Modify, or Reject proposals.
- Every action captures the owner's signature and resolved outcome.

Proof of Learning Loop

- **Key Points**:
- Every approved decision is written back to the central repository.
- Future investigations instantly match against previous case solutions.
- **Example**: AURA's face wash cap leak automatically matches and applies the solution from VIVA's shaker-bottle hinge failure months prior.

Dynamic Scenario Validation

- **Key Points:**
- **10/10 End-to-End Validation Scenarios Passed:** Verified routing, trend extraction, RAG, memory recall, and HITL workflow.
- **Evidence-Based Routing:** Maps brand/product query contexts across AURA, NEXA, VIVA, and handles unknown brand scenarios.
- **Dynamic Trend Extraction:** Compares current vs previous 30-day complaint rate periods.
- **Cross-Brand Precedent Surf:** Surfaces matching historic solutions across brand portfolios using TF-IDF similarity.
- **Rapid Execution Speed:** Investigations compiled in under 50ms average local query latency.
- **Note:** Performance metrics are based on synthetic demonstration data and local prototype runs.*

30-Day Roadmap to Enterprise Deployment

- **Key Points:**
- **Days 1–5:** Core Setup, database schema finalization, and ingestion pipeline.
- **Days 6–10:** Document processing optimization, live embedding caching, and vector indexing.
- **Days 11–15:** Deploy agent logic, LLM providers (GPT/Gemini), and prompt engineering.
- **Days 16–20:** Human approval dashboard and tracking outcomes.
- **Days 21–25:** High-performance UI screens (Dashboard, ask consoles, memory searches).
- **Days 26–30:** Live staging deploy, audits, and performance tuning.

The Think9 Autonomous Platform

- **Key Points**:
- Automatic Slack/Email alert triggers when product ratings fall below threshold.
- Automatic integration with logistics APIs to track shipping delivery status.
- Real-time supplier stock forecasting and risk mitigation.
